

A public project was promised. What happened next?

Imagine Amina, a resident in Abuja. She remembers the promise, but she cannot find one clear, trusted record of what happened after the announcement.

ShaídaGo

One question:
what happened?

One safe path
from evidence
to action.

Amina is one example of a much larger information gap.

Across many African communities, access to rights and public services depends on information people can find, understand and trust.

She finds fragments

An announcement may sit on one website, a later update on another, and community concerns somewhere else.

She has to judge them

A headline does not tell her what is current, what the source supports or what is still unknown.

She needs a next step

If something looks wrong, she still needs a safe place to raise it and a way to follow the response.

I built ShaídaGo for the moment when finding information is no longer enough.

ShaidaGo gives Amina a clear way through.

One journey connects the public promise, the resident's concern and the reviewed response.

First, she can see why the record should be trusted.

When was this checked?

Current recorded state

Recorded status	Last checked
In progress	4 March 2026

The recorded status is what this record says. It is not a verdict. Each statement below shows how well it is supported.

?

This record was last checked more than 90 days ago.

What does the source say?

Source 1

The works are planned for the synthetic council.

Synthetic works bulletin, Synthetic Works Ministry, Page 2

[Open the source page](#)

Amina does not have to trust ShaidaGo blindly. She can inspect the source herself.

Then she can raise a concern without exposing her identity.

Reporting stays private

Amina does not need an account, email address or phone number. Her report does not appear on the public record.

Status and actions

Status: Received

Risk: Standard

Change the status

Action

Start review

She gets a private tracking code, so speaking up does not mean losing sight of what happens next.

Her report does not disappear into a form.

Amina can come back

Her tracking code shows progress and lets her answer a reviewer without revealing who she is.

A reviewer has a clear duty

The reviewer checks the private evidence. Only approved citations can support a separate public update.

The private report stays private. The public record changes only after human review.

ShaidaGo is designed for the way Amina gets online.

English
Hausa
Igbo
Yoruba

Useful on a weak connection

Public pages render on the server. Low-data mode and saved records keep the core information available with less data.

Built for everyday use

The complete interface is available in four languages, with plain labels, keyboard support and mobile layouts.

AI helps with the work. Evidence remains in charge.

How I built it

I used AI coding tools to implement, test and debug the product. I set the scope, chose the design and reviewed the changes.

How Amina uses it

She can ask questions of approved evidence. Source Scout can find related public material. Every answer must point back to a source.

AI can help Amina understand the record. A person decides what reaches the public record.

This is the capstone brief made real for one resident.

Information she can trust

The source, exact passage and check date sit beside the public record.

Privacy when it matters

Amina can report without an account or contact details, and her report stays restricted to reviewers.

Access that fits her reality

The experience works on mobile, uses less data and is available in four languages.

A clear way forward

She can keep a tracking code, follow progress and answer a reviewer. The process ends with a human decision.

Now Amina's question has somewhere to go.

Start in Abuja

The working pilot begins
with AMAC and Bwari.

Build with local context

Each community needs its own
languages, institutions and
escalation routes.

Keep one promise

People can see the evidence,
raise a concern safely and
follow the response.
